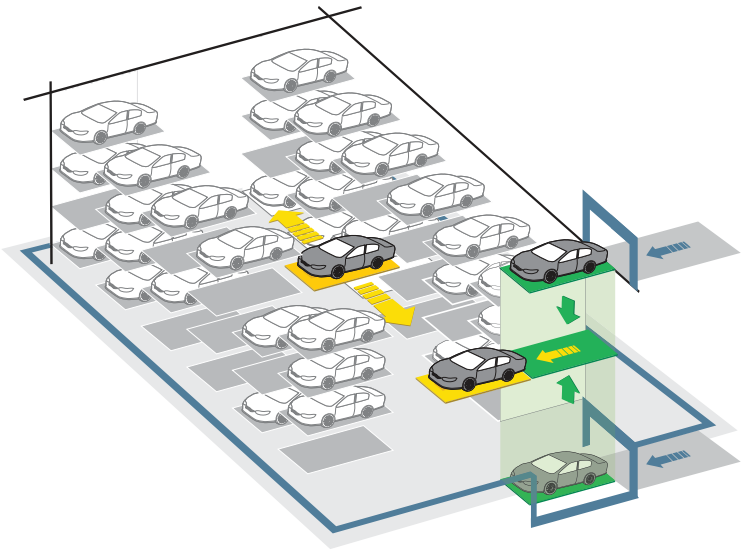
MULTI PARKING SYSTEM



The Multi-Parking system sometimes referred to as Rack and Rail type has been designed to automatically move the vehicles by lift which then transfers it to a waiting cart on one of the multi- levels. The carts then travel horizontally and place the vehicle in its appropriate slot. This system is suitable for middle and large-scale buildings as well as independent public parking garage.

The multi-parker can accommodate as little as 20 vehicles to several thousand units. It is therefore suitable for large scale projects. It can move more than 2 vehicles at the same time for maximum efficiency.
